...   order of tables. The administrator first assigns relative weights
to the tables in the catalog: The bigger the table, the bigger its weight.
When creating **SQL   queries** , Impromptu uses these weights by ordering the
tables in the FROM **clause** from smallest to biggest. In most cases, this
enables Impromptu to better optimize **queries** . This feature is especially
desirable when used with a **database** that doesn't include a cost-based
optimizer--for example, Oracle 6.0.
     Security and User Profiles
     Both Esperant and Impromptu address the need for **database** security,
although with varying degrees of completeness. While Esperant's security
features are adequate for many users' needs, it lacks some advanced
features that may...

...and flexible security model designed with the larger enterprise in mind.
     Esperant's security module is oriented toward restricting user access
to features within the **query** tool itself. The administrator can control
which menu items are available to users, but you cannot restrict users'
access to tables and columns. Esperant letsYou are unable to override the
user group profile at the User level, however--if one user in a **group**
requires only **one** or two profile **changes** , you will have to create a new
group.
     Impromptu provides a broader and more impressive set of security
features. The administrator can set up user...

...Missouri sales figures. Filters can be placed on a table-by-table basis.
     While both Esperant and Impromptu let the administrator limit the cost
of **queries** , Impromptu is slightly more configurable. Both products let
you prevent users from performing outer joins or from suppressing duplicate
rows. In addition, the administrator can limit the amount of time a **query**
can run or the number of rows a **query** can return. Impromptu can notify
users as to approximately how long the **query** will take to execute, giving
them a chance to think twice before execution.
     Impromptu also provides client/server partitioning, letting the
administrator balance the processing...

...   large number of tables is particularly helpful when issuing
SQL-SELECT commands. After all, SQL does a USE..AGAIN for each table in the
 FROM **clause** . The USE...AGAIN is significantly faster than initially

opening a table (0.0007 seconds vs. 0.17 seconds). When we had only 25 work areas in which to USE..AGAIN we frequently had to close tables and let **SQL** reopen them. This led to a decrease in performance.

The increased number of work areas also means that you may have more BROWSE windows. Theoretically...

...area but doesn't reposition the work area pointer. As a result, programmers need to add a line of code to SELECT the newly opened **database**
.

In FoxPro 2.5 you may USE <table> IN0. This version of the USE command will open the named table in the next lowest available work area but, like SELECT(1), does not reposition the work area pointer. This does not **replace** :
SELECT 0 USE <table>
More on the environment
While most of the environment information can be found within the VIEW window, not everything of interest is there...

**The perfect API. (evaluating application programming interfaces) (DB
Connections)**
Buzzard, James
Data Based Advisor, v8, n5, p104(7)
May, 1990
ISSN: 0740-5200 LANGUAGE: ENGLISH RECORD TYPE: FULLTEXT; ABSTRACT
WORD COUNT: 3892 LINE COUNT: 00314

... server (in the first variable of the pair) should be considered a null. Indicator variables are used by Oracle Server and IBM OS/2 EE **Database** Manager.

Using indicator variables requires programmers to check the indicator before manipulating the **query** results (which is a lot of extra work).
Substitution values
Substitution values are special values used for each type of data (numeric, character, etc.) to represent null values. The **database** server API converts the null values returned by the server to the appropriate substitution values. Substitution values are used by Microsoft **SQL** Server's API, DB-LIBRARY.

Using substitution values requires programmers to come up with values that can't possibly be mistaken for actual data. For example, an empty string for character data or zero for numeric data may not qualify as suitable **substitution** values in situations **where** empty strings and **zero** values are valid data.
Updates with null values
The API should also provide some way to insert null values into the **database** . If the contents of a column of a **SQL** UPDATE or INSERT statement (used to change values in existing rows or add new rows) need to be explicitly set to null, the API must have some way to indicate this.

In APIs that use indicator variables, null values are usually inserted by setting the indicator variable in the **SQL** statement for that particular column to the value that indicates a null. In APIs that use substitution values, the substitution value that corresponds to a...

...most client applications, the program requests information from the user, stores the information in program variables, and then uses the variables as part of a **SQL** statement sent to the **database** server.

To ease the task of writing and debugging client applications, programmers should be able to define the variables used in embedded **SQL** statements as regular host-language variables. Having to use special data types or declarations for variables used in embedded **SQL** **statements** increases program complexity and reduces program portability between database systems (as well as violating Rule 4). Ideally, converting between server data types and host-language...

...be supported transparently by the API.

    Most precompiler APIs require you to bracket the standard
host-language declarations, initializations, or variables used in embedded
SQL **statements** with special indicators. These indicators help the
precompiler find the host variables in your source code, so they can be
used semantically to check the embedded SQL **statements** .

    Support for national languages
and collating sequences

    If you develop applications used in non-English speaking countries,
you may find that translating your application requires...

...report by Culbert, J.L.
Operating earnings will rise 13% in 1993 as current momentum in personal
lines insurance carries through. In 4Q:92, Allied **Group** , Inc. **exchanged**
 1 .8 million common shares for an equal number of nonconvertible preferred
with its mutual insurance company parent, Allied Mutual Insurance. This
reduction in outstanding shares...

...show deceleration in revenue and profitability.

...   is to contract one company to handle the audio-visual requirements for all your meetings. Either way, equipment must be pre-tested. Be sure to **query** presenters on their audio-visual needs at least a month or more before the program. (See "Multimedia Mistakes" next to problem #9.)

8. Unfair or Misleading
Cancellation Clasues

Ideally, cancellation **clauses** should protect both buyer and seller from default. In real life, it's often a different story. Planners should have legal counsel review cancellation **clauses** and, **where** appropriate,

suggest **changes** .

One corporate planner stipulates that her company will pay only for cancelled rooms the hotel is unable to resell. Another asks the hotel to agree not...

...a 12-month period. The bottom line: Avoid unclear language and stipulate that both parties agree to any changes or additions to the original cancellation **clause** .

9. Billing Surprises

Weeks after you thought you had settled all your meeting's accounts, an unexpected bill arrives. The battle is on.

To avoid...

...TEXT: $forbid(\alpha) \leftarrow forbid(\beta), commit(\alpha, \beta)$ (from [DT4])

[DR8] $waive(\alpha) \leftarrow waive(\beta), commit(\alpha, \beta)$ (from [DT5]).

Given a program P and a **query** $\leftarrow \phi$, we define a state:

$$\sigma_0 = \langle(\phi), 0\rangle,$$

where 0 is the empty **substitution** . Let us define possible transformal states of σ_0 as follows:

(Equation omitted),
where $\phi = \psi$ from a definitional relationship between deontic predicates (i...

...for every $\psi \leftarrow \psi_1, \psi_2, ..., \psi_n$ element of P such that $\phi\theta_1 = \psi\theta_1$, **where** θ_1 is a **substitution** :

$$\theta_1 = (x_1 = t_1, x_2 = t_2, ..., x_k = t_k),$$

where x_1...

... composition of substitutions (as defined in [3, 24]). Then, $\theta_1\theta_2 ...\theta_m$ is given as an answer to the **query** . Generations of θ_m for all nondeterministic choices of state transformations are done via the backtracking techniques [3, 24].

The computing process in this section is obtained by program **clause** logic programming of selected deontic logic axioms and theorems. It can be summarized as follows: By not allowing compound terms as arguments of deontic operators, we have a first-order reasoning system. By expressing deontic axioms and theorems as program **clauses** , we made logic programming of deontic features possible.

2.3. Toward a Deontic Expert System

An expert system is an interactive computer system [6] that...

...   ERI, Hauppauge, N.Y., is a software product which ERI said will
allow users of the desktop publishing package FrameMaker to import data
from Sybase **SQL** **databases** that are already formatted and ready to
print.
     The software, called a Sybase agent, will sell for $5,000 per site
license, said Gary Budnick, product manager. Without such a product, data
must be exported from the **database** as an ASCII file, then imported into
FrameMaker and formatted-a more time-consuming and difficult process,
Budnick said.
     The agent, which is accessed through a GUI, also will let users
choose among **databases** and issue SELECT **statements** , though it doesn't
allow inserts or deletions, Budnick said. More complex **queries** can be
created in a text window.
     To use the agent, users must also have licensed the FrameMaker agent
($4,000 for a site license...

...ERI ($500 each).
     Additional agents are available from Crossroad for Lotus 1-2-3 (
$3,000) and XRT Graph, a graphing package from the KL **Group** , of Toronto,
Canada ($ **1** ,000). Data can be **exchanged** among all applications for
which agents have been installed, Budnick said. ERI can be reached at
516-232-5560.
